**Table S1:** Stratigraphic range chart of the Gault Clay, Copt Point section (41 samples) showing the distribution of nannofossils. Estimation of the semi-quantitative abundance of species was recorded as per the scale; Abundant (A): >10 specimens per field of view (FOV); Common (C): 1–10 specimens per FOV; Frequent (F): at least 1 specimen per 10 FOVs; Rare (R): 1 specimen in > 10 FOVs; Very Rare (VR): only 1 or 2 specimens observed in the sample. An estimate of total nannofossil abundance in a sample was recorded as; High (H): each FOV has > 20–30 nannofossils; Moderate (M): each FOV has 10–20 nannofossils. Preservation of nannofossils was recorded as VG: Very Good; G: Good; and M: Moderate. Full explanation of the preservation categories is given in the text.

**Table S2:** Relative abundance (%) data of the major nannofossil taxa based on 300+ counts performed on 41 samples.

**Table S3:** Percentage distribution of Tethyan ammonites from Beds I–X, Gault Clay (Copt Point).

**Table S4:** Bulk sediment oxygen isotope ( $\delta^{18}\text{O}_{\text{bulk}}\text{\textperthousand}$ ), carbon isotope ( $\delta^{13}\text{C}_{\text{bulk}}\text{\textperthousand}$ ), carbonate ( $\text{CaCO}_3$ , wt %) and TOC (wt %) data for 44 Gault Clay samples (Copt Point).
