EMSIAN

Miospore assemblages which can be positively assigned to the Early Devonian have, to date, only been recorded from core material from Well A1-33. Assemblages of Emsian age were recorded from the interval 8079 to 8091 ft. whilst assemblages from 8055 to 8076 ft. contain some taxa which are common in the Emsian elsewhere but are not diagnostic. Assemblages recovered from sediments in the interval 9700 to 9709 ft. in Well A1-33 were dominated by leiospheres together with smaller numbers of acanthomorph acritarchs. The age of this interval is unknown but it could be as old as Ordovician.

The Emsian assemblages recovered from the interval between 8079 to 8091 ft. contain a wide variety of azonate miospores together with species possessing an equatorial crassitude, specimens with zonate extensions are rare. Miospores with sculptural or structural modifications around their equators are relatively common i.e. ?*Procoronaspora* sp., *Diatomozonotriletes* sp. A. and *Craspedispora craspeda*. The presence in these assemblages of *Emphanisporites annulatus*, *E. erraticus*, *E. rotatus*, *E. cf. decoratus*, *E. obscurus*, *Dibolisporites eifeliensis*, *D. cf. gibberosus*, *D. echinaceus*, *Apiculoretusporites brandtii* together with small tripapillate miospores suggest an Early or Middle Emsian age to be probable. The assemblages are closely comparable with Emsian microfloras recorded in the Polignac Basin of Algeria (Jardiné & Yapaudjian, 1968) and the Rhadames Basin of Western Libya (Massa & Moreau-Benoit, 1976).

EIFELIAN

Miospore assemblages of probable Eifelian age have been recovered from Well A1-37 from cored material at 10674 ft. The miospore populations which are extremely well preserved contain representatives of the following taxa:—*Anapiculatisporites* sp., *Dibolisporites* cf. *bullatus*, *Hystricosporites* spp., *Emphanisporites spinaeformis*, *Diatomozonotriletes* sp., *Calyptosporites* cf. *velatus*, *C. cf. spinosus*, *Grandispora* cf. *libyensis*, *Samarisporites* sp. A., *S. cf. megaformis*, ? *Spinozonotriletes* cf. *naumovii*, ‘*Hymenozonotriletes*’ *discors* and *Ancyrospora nettersheimensis*. This assemblage is closely comparable with other previously reported Eifelian

population from Algeria (Jardiné & Yapaudjian, 1968), Saudi Arabia (Hemer & Nygreen, 1966) and Western Libya (Massa & Moreau-Benoit, 1976). Despite close similarity at generic level between the composition of the northeast Libyan assemblages with those from the Rhenish Middle Devonian of the Eifel region of Germany, comparison at specific level is almost impossible. The presence in the Libyan material of *Ancyrospora nettersheimensis* is however of interest since this species was found to be confined to the Late Emsian and Early Eifelian in the Eifel region (Riegel, 1974).

GIVETIAN

Givetian miospore assemblages have been encountered in several wells including A1-37, B1-31, E1-82 and G1-82. Diagnostic components in these assemblages include *Acinosporites acanthomammillatus*, *A. macrospinosis*, *Dibolisporites echinaceus*, *Geminospora tuberculata*, *Grandispora inculta*, *G. libyensis*, *Rhabdosporites langii*, *Verrucosporites premnus* and *V. scurrus*, and suggest an early Givetian age.

Chitinozoan populations have been recovered from the same horizons as the above miospore assemblages in Well A1-37 in the interval between 9251 to 9840 ft. The assemblage recovered from the sample at 9840 ft. is the most diversified in composition with representatives of *Eisenackitina castor* (*sensu* J. A. Legault, 1973) being the dominant component. Amongst the other species present are forms sometimes erroneously attributed to *Angochitina devonica* but here referred to as *Gotlandochitina* sp. B. In addition there are isolated individuals identified as *Gotlandochitina milanensis*, *Ancyrochitina ?aequoris* and *Hoegisphaera glabra* which were recorded as common components of the lower part of the Aouinet-Ouenine II Formation in the Rhadames Basin of western Libya by Massa & Moreau-Benoit (1976) which is also considered to be of Early Givetian age. Chitinozoan assemblages recovered from younger sediments at 9251 and 9290 ft. in Well A1-37 are dominated by *Fungochitina pilosa*, a species which has previously been recorded from both Givetian and Frasnian sediments in the Rhadames Basin of western Libya, northern France and the U.S.A. (Taugourdeau, Ph. 1965; Collinson, C. & Scott, A. J., 1958 and Urban, J. B. and Newport, R. L., 1973).

FRASNIAN

Assemblages of Frasnian palynomorphs which have been recorded in Well C1-125 in the interval 10300 to 11000 ft. and in Well A1-115 between 8762 to 8784 ft. are characterised by the occurrence of the following miospore taxa:— *Verrucosporites bullatus*, *Samarisporites triangulatus*, *Ancyrospora langi* and *A. multifurcata*. The presence in these assemblages of the acritarchs *Horologinella quadrispina*, *H. horologia*, *Unellium winslowae* and *Villosacapsula globosa* suggests by comparison with their previously known distribution in the Algerian Sahara (Jardiné *et al.*, 1974) a Late Frasnian age. *Villosacapsula globosa* has previously been found in Belgium to be restricted to a narrow zone transitional to the Frasnian – Famennian boundary.

FAMENNIAN

Earliest Famennian palynomorphs have been recorded in Well A1-NC-92 in the interval 13400 to 13500 ft., where the diagnostic miospore *Cyrtospora cristifer* occurs in association with the distinctive Frasnian–Famennian boundary association of acritarchs including *Crassiangularina tesselata*, *Umbellasphaeridium deflandrei*, *Unellium winslowae*, *Veryhachium pannuceum* and *Villosacapsula globosa*.

Late Famennian miospore populations are characterised by the presence of *Leiotriletes libyensis*, *Rugospora flexuosa* and abundant representatives of *Spelaeotriletes cf. crustatus*. Distinctive assemblages of latest Famennian (Strunian) age with the characteristic miospore *Retispora lepidophyta* accompanied by *Knoxisporites literatus* and *Vallatisporites pusillites* were

recorded in Well C1-125 in the interval 9300 to 9700 ft. and in Well A1-37 between 8418 and 8421 ft. These miospore populations are accompanied by acritarchs of the sphaeromorph and acanthomorph type in which the genera *Gorgonisphaeridium* and *Lophosphaeridium* predominate.

Explanation of Plate 25

All figures are $\times 500$ unless otherwise indicated

Fig. 1. *Geminospora* sp. E1-82, Core 7, 1319m., S.G. 1319/76, AGC 256.

Fig. 2. *Geminospora tuberculata* (Kedo) Allen, 1965. E1-82, Core 7, 1319m., S.G. 1319/28, AGC 257.

Fig. 3. *Calyptosporites proteus* (Naumova) Allen, 1965. J1-81A, 15685 ft., AGC 258.

Fig. 4. *Rhabdosporites* sp. E1-82, Core 7, 1319m., S.G. 1319/64, AGC 259.

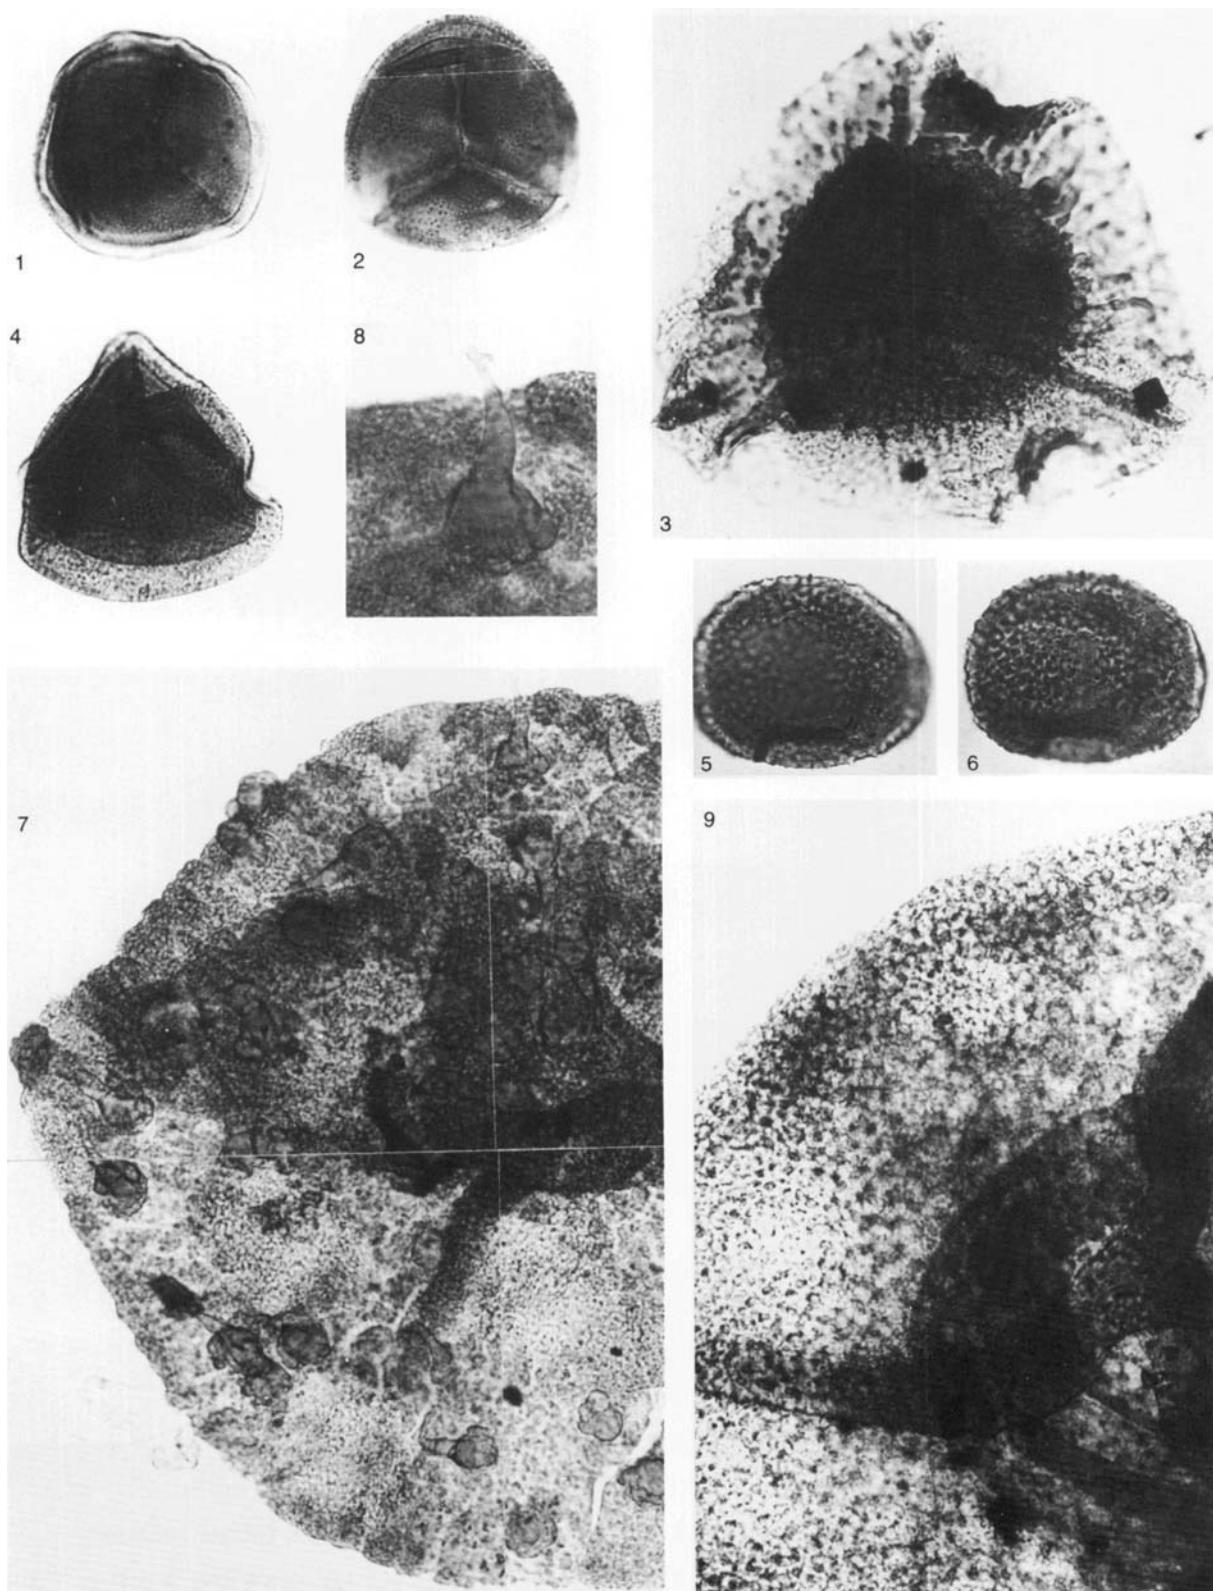

Figs. 5, 6. "Monolete" verrucate spore. E1-82. Core 7, 1319m., S.G. 1319/2, AGC 260.

Figs. 7, 8. *Hystricosporites* sp. megaspore. E1-82. Core 7, 1319m., S.G. 1319/11, AGC 261. (Fig. 8: Detail of specimen in Fig. 7, 1000 \times).

Fig. 9. *Biharisporites* sp. E1-82. Core 7, 1319m., S.G. 1319/40, AGC 262.

Givetian Miospores

Plate 25

Explanation of Plate 26
All figures are $\times 500$

- Fig. 1. *Tasmanites* sp. I1C-81, SWC 5806, AGC 263.
- Fig. 2. *Leiosphaeridia* sp. I1C-81, SWC 5806, AGC 264.
- Fig. 3. *Gorgonisphaeridium* sp. I1C-81, SWC 5806, AGC 265.
- Fig. 4. *Polyedryxium pharaonis* Deunff, 1961. J1-81A, 15685 ft., AGC 266.
- Figs. 5, 6. *Polyedryxium fragosulum* Playford, 1977. I1C-81, SWC 5806, AGC 267. (phase contrast).
- Fig. 7. *Incertae sedis*. E1-82, Core 7, 1319 m., S.G. 1319/40, AGC 268. Bipolar body with 4 resp. 6 hollow “bifurcate” appendages at poles (see Doubinger 1966).

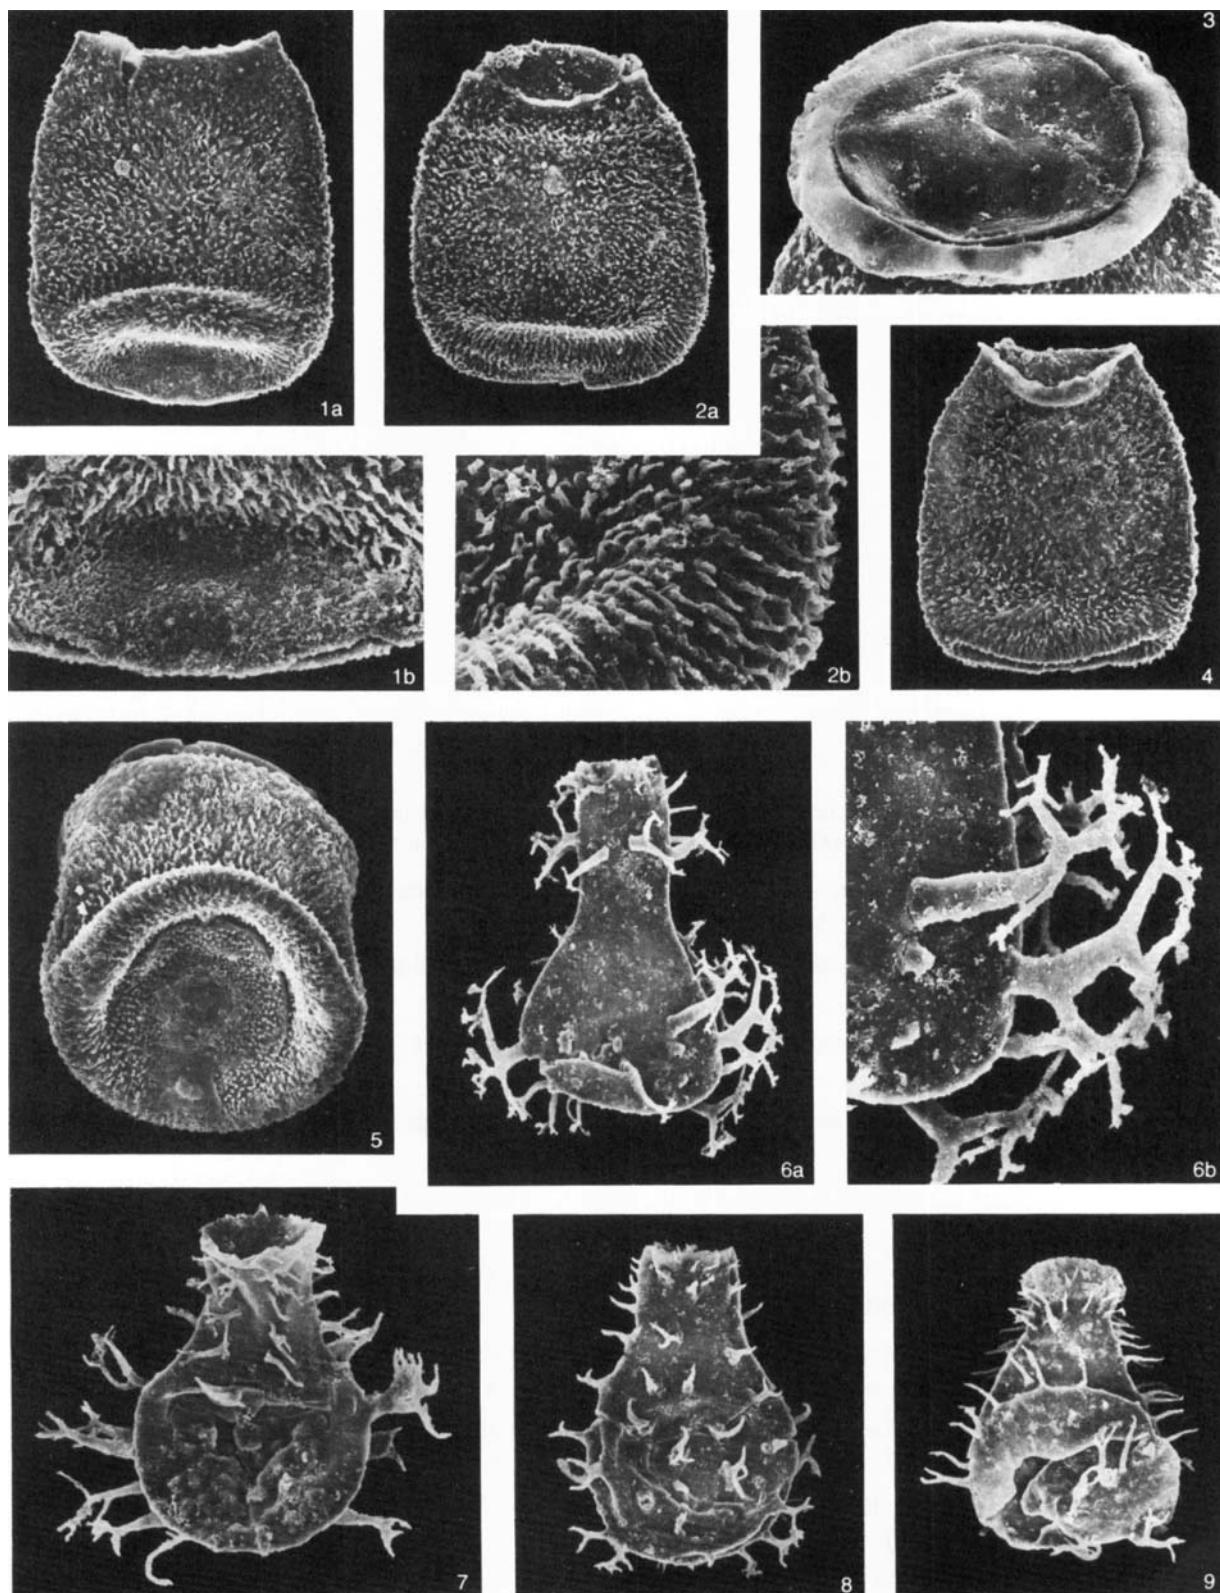

Explanation of Plate 27

- Fig. 1a, b. *Eisenackitina castor* Jansonius, 1964. sensu Legault, 1973. A1-37, 9840ft., Slide 13, N35/2, 1a: $\times 300$; 1b: $\times 750$, AGC 270. (The spinous forms are restricted to the Givetian while *E. castor* s.s. occurs in Late Eifelian).
- Fig. 2a, b. *Eisenackitina castor* Jansonius, 1964. sensu Legault, 1973. A1-37, 9840ft., Slide 13, Q35/1, 2a: $\times 300$; 2b: $\times 1250$, AGC 271. (Givetian).
- Fig. 3. Oral pole (collarette and operculum) of *Eisenackitina castor* Jansonius, 1964, sensu Legault, 1973. A1-37, 9840ft., Slide 13, 038/2, $\times 750$, AGC 272.
- Fig. 4. *Eisenackitina castor* Jansonius, 1964, sensu Legault, 1973. A1-37, 9840ft., Slide 13, Q37/4, $\times 300$, AGC 273. (Givetian).
- Fig. 5. *Eisenackitina castor* Jansonius, 1964, sensu Legault, 1973. A1-37, 9840ft., Slide 13, M34/4, $\times 400$, AGC 274. (Givetian).
- Fig. 6a, b. *Gotlandochitina?* sp. A. A1-37, 9840ft., Slide 13, N38, 6a: $\times 300$; 6b: $\times 750$, AGC 275.
- Fig. 7. *Gotlandochitina* sp. A1-37, 9840ft., Slide 13, P36/4, $\times 400$, AGC 276.
- Fig. 8. *Gotlandochitina milanensis* (Collinson & Scott, 1958). A1-37, 9840ft., Slide 13, P38/4, $\times 300$, AGC 277. (Givetian).
- Fig. 9. *Ancyrochitina? aequoris* Urban & Kline, 1970. A1-37, 9840ft., Slide 13, 037/3, $\times 300$, AGC 278. (Givetian).

Plate 27

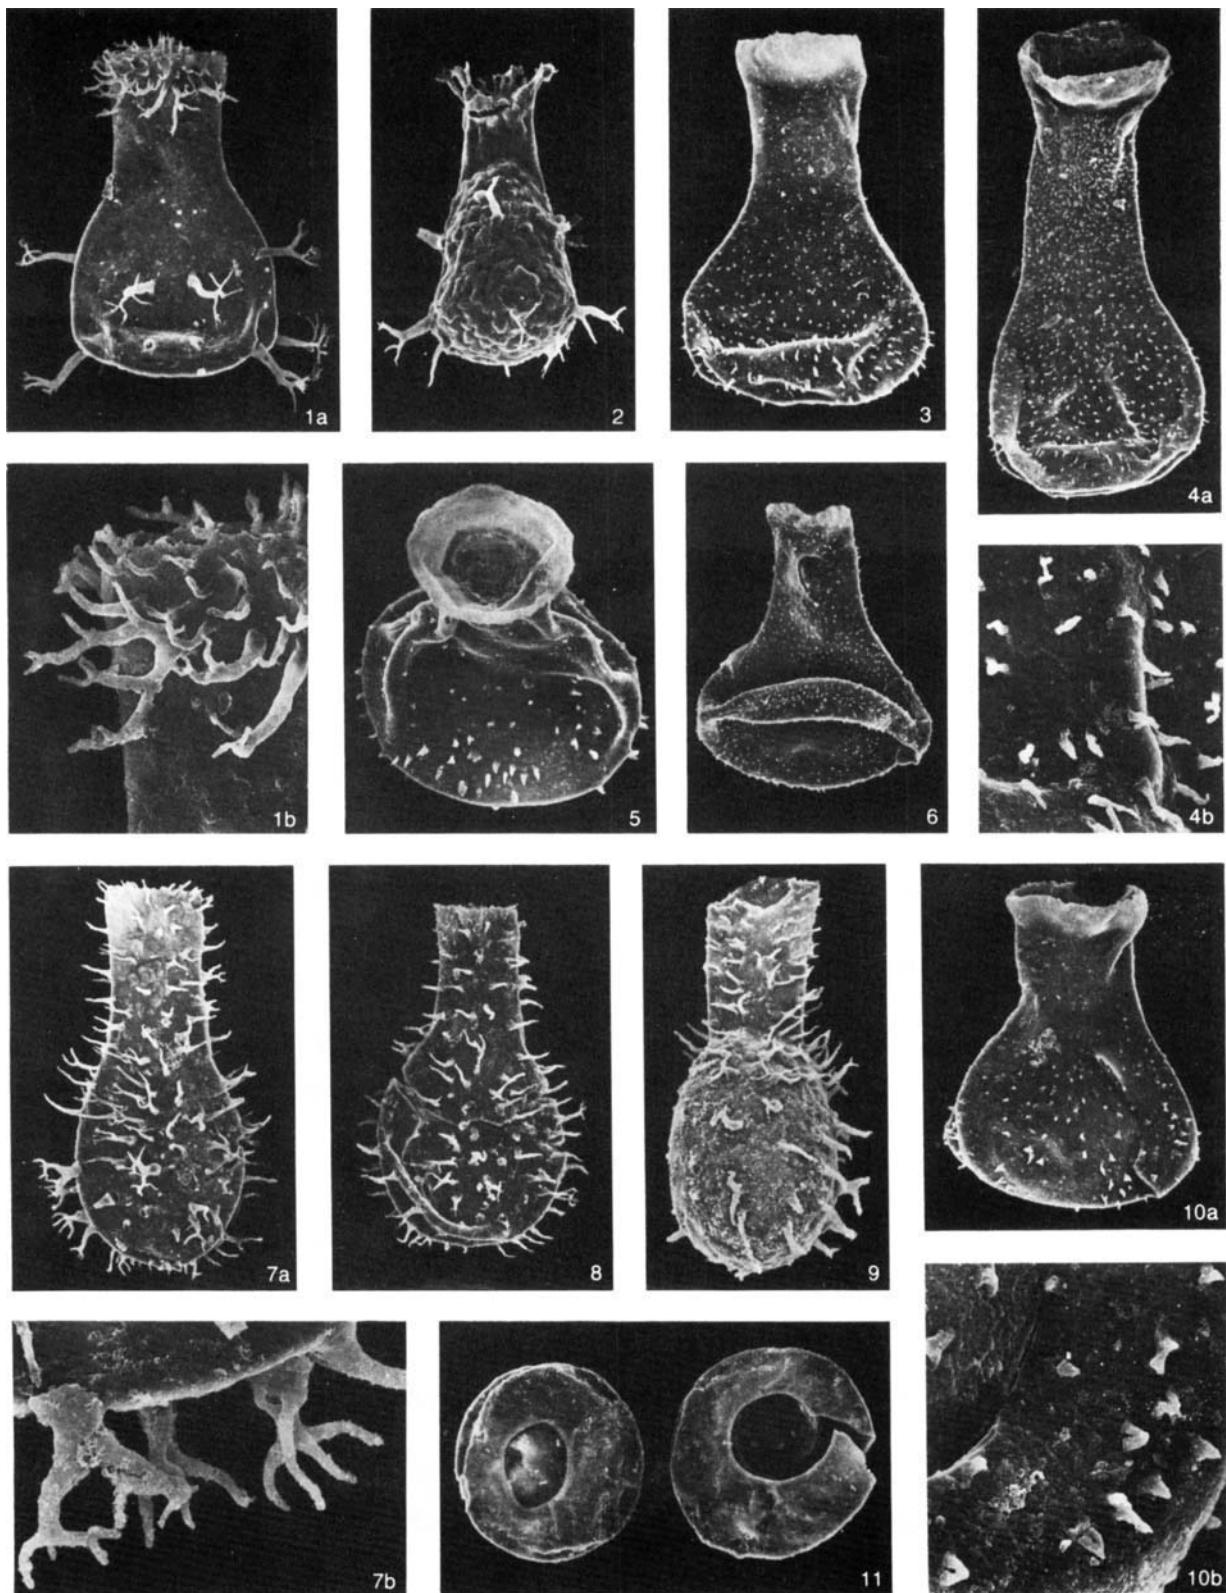

Explanation of Plate 28

- Fig. 1a, b. *Alpenachitina eisenacki* Dunn & Miller, 1964. Contaminated cuttings from J1-81A, 12800-12850ft., (Ashgill), Slide 2, N38/3, 1a: $\times 300$; 1b: $\times 1000$, AGC 279. (Eifelian-Givetian).
- Fig. 2. *Alpenachitina eisenacki* Dunn & Miller, 1964. Contaminated cuttings from J1-81A, 12950-13000ft., (Ashgill), Slide 1, M39/4, $\times 300$, AGC 280. (Eifelian-Givetian).
- Fig. 3. *Fungochitina pilosa* (Collinson & Scott, 1958). A1-37, 9251ft., Slide 15, 039, $\times 300$, AGC 281. (Eifelian-Frasnian).
- Fig. 4a, b. *Fungochitina pilosa* (Collinson & Scott, 1958). A1-37, 9251ft., Slide 15, 038, 4a: $\times 250$; 4b: $\times 1250$, AGC 282. (Eifelian-Frasnian).
- Fig. 5. *Fungochitina pilosa* (Collinson & Scott, 1958). A1-37, 9251ft., Slide 15, R43/1, $\times 400$, AGC 283. (Eifelian-Frasnian).
- Fig. 6. *Fungochitina pilosa* (Collinson & Scott, 1958). A1-37, 9290ft., Slide 14, L43, $\times 300$, AGC 284. (Eifelian-Frasnian).
- Fig. 7a-b. *Gotlandochitina* sp. B. (= *Angochitina devonica* Eisenack, 1955, sensu Urban, 1972). A1-37, 9840ft., Slide 13, Q35, 7a: $\times 250$; 7b: $\times 1000$, AGC 285. (*A. devonica* s.l. is reported from the Pragian up to the Frasnian).
- Fig. 8. *Gotlandochitina* sp. B. (= *Angochitina devonica* Eisenack, 1955, sensu Urban, 1972). A1-37, 9840ft., Slide 13, Q35/1, $\times 250$, AGC 286. (*A. devonica* s.l. is reported from the Pragian up to the Frasnian).
- Fig. 9. *Gotlandochitina* sp. B. (= *Angochitina devonica* Eisenack, 1955, sensu Urban, 1972). A1-37, 9840ft., Slide 13, P34, $\times 300$, AGC 287. (*A. devonica* s.l. is reported from the Pragian up to the Frasnian).
- Fig. 10a, b. *Fungochitina pilosa* (Collinson & Scott, 1958). A1-37, 9251ft., Slide 15, Q37/2, 10a: $\times 300$; 10b: $\times 1250$, AGC 288. (Eifelian-Frasnian).
- Fig. 11 *Hoegisphaera glabra* Staplin, 1961. A1-37, 9840ft., Slide 13, Q34/1, $\times 300$, AGC 289. (Late Pragian-Early Frasnian; typical *H. glabra* are restricted to the Early Frasnian).
